

SKF

SKF lock nuts - the components for quick location

Contents

Made by SKF® stands for excellence. It symbolises our consistent endeavour to achieve total quality in everything we do. For those who use our products, “Made by SKF” implies three main benefits.

Reliability – thanks to modern, efficient products, based on our worldwide application know-how, optimised materials, forward-looking designs and the most advanced production techniques.

Cost effectiveness – resulting from the favourable ratio between our product quality plus service facilities, and the purchase price of the product.

Market lead – which you can achieve by taking advantage of our products and services. Increased operating time and reduced down-time, as well as improved output and product quality are the key to a successful partnership.

The SKF Group – a worldwide organisation 20

Fast, easy and efficient mounting

Lock nuts locate bearings and other components on shafts and facilitate mounting and dismounting. SKF supplies a wide range of lock nuts. They ensure long bearing service life and reliable locking and can prevent bearing fitting damages. SKF lock nuts are easy to mount, do not damage the shaft and ensure effective locking.

Five types to choose from

Of course it would be possible to produce just one lock nut for all requirements, but this would be nothing but a compromise: too expensive for a great number of applications, for many others technically not sufficiently advanced.

Therefore the SKF product range comprises five types, each having its advantages in function and application. SKF lock nuts cover a large range of both metric and inch sizes.

Fast, easy and efficient mounting

KMT lock nuts

SKF KMT lock nuts are high precision components. The nut is locked by means

of three radial brass locking pins arranged at the same angle as the thread flanks. This removes the need for a locking washer and keyway. The nut can be accurately located at right angles to the shaft by means of the radial locking pins and can be re-used.

KMTA lock nuts

SKF lock nuts of KMTA design are manufactured to the same high precision as KMT

lock nuts. The locking principle and the ability to be located at right angles to the shaft are the same as for KMT.

KMTA lock nuts are of a compact design and are intended for applications where space is limited. They can be re-used.

KMK lock nuts

SKF lock nuts of KMK design lock quickly and safely without the need for a locking

washer and keyway. The KMK nut is locked in position with a steel insert, an integral part of the nut thread, which presses against the shaft thread. The nut remains perpendicular to the shaft when the insert is pressed against the shaft thread. KMK nuts are also re-usable

KMF lock nuts

SKF has developed a new range of lock nuts with internal locking system to supple-

ment its existing nuts. The special design feature of the KMF lock nuts is the locking principle. A small part of the nut thread is pressed into the shaft thread by a locking screw and prevents the nut from turning.

Mounting and dismounting are easy and the positive locking effect is secure. Keyways in the shaft and additional locking washers are not needed.

Simple tools can be used similar to those for KM(L) and KMK nuts. KMF nuts are also re-usable.

KM(L) lock nuts

The SKF lock nut KM(L) when used in conjunction with an MB(L) locking washer is a simple, stable and reliable fastening element.

Simple, stable and reliable fastening element.

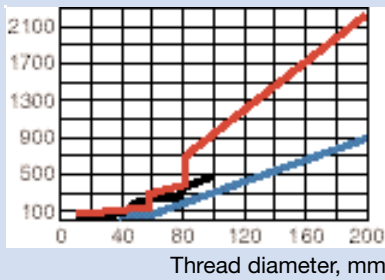

Adjustable to minimise runout

Both KMT and KMTA lock nuts have the same unique design using three equally spaced locking pins aligned at the same angle to the shaft axis as the thread flanks (→ fig 1). This design makes it very easy to align the lock nut at right angles to the shaft axis. The locking pins can be individually adjusted to minimise radial and axial runouts.

For further information please refer to the SKF General Catalogue, the SKF catalogue 3766 "Bearing accessories" and the "SKF Interactive Engineering Catalogue".

SKF spanner set TMHN 7 for lock nuts

It is essential when mounting self-aligning bearings on adapter sleeves to obtain the correct radial clearance. Failure to do so will result in a shortened bearing life and a sub-optimal performance. A set of seven spanners has been specially designed for this purpose (→ Table 1).

Each spanner is clearly marked with the correct tightening angle, ensuring that the optimum drive-up the adapter sleeve is obtained. The correct radial clearance will then remain after locking the sleeve nut.

SKF lock nut spanner makes an "impossible" job simple

- Seven different spanners for fitting KM lock nuts size 5 to 11.
- Each spanner is clearly marked with the correct tightening angle.
- The spanner engages the nut in four positions giving a secure grip.

Loosening torque

Diagram 1 illustrates the locking capability of the nuts described in this brochure. The KM(L) lock nuts have been used together with MB(L) locking washers. The lock nuts were tested on a threaded shaft and screwed tightly against a shoulder. No axial load was applied. The grub screws of the KMT, KMTA, KMK and KMF lock nuts are tightened with the torques stated in the product tables.

Permissible axial load

KMT and KMTA lock nuts withstand higher axial loads than most other lock nuts because the entire threaded length of the nut can absorb the load (→ Diagram 2).

Keeping a firm grip on trouble-free operation

Trouble-free operation of bearings and other components depends not only on the components in question but also on the adjacent parts. Correct mounting and regular maintenance are no less important in order to prevent unplanned machine downtime. Many operators know this correlation and take appropriate care.

Therefore, SKF lock nuts are used in many different production areas. They contribute to high quality, high reliability and the high precision of the final product.

KMT lock nuts for high precision

Material: High-strength steel
Finish: Phosphated and saturated with oil
Locking pin: Hard drawn brass
Grub screw: Type MT6SS short pin (DIN 915, 45H)
Thread tolerance: 5H (ISO 965/3-1980)
Recommended tolerance for shaft threads: 6g (ISO 965/3-1980)

A high-precision lock nut

The thread and clamping face are machined in the same set-up. The maximum runout between locating face and thread is 0,005 mm.

Locks without a locking washer and keyway

KMT lock nuts are locked by three radial brass pins which are arranged at the same angle as the thread flanks. The locking faces of the pins and the nut thread are machined in a single operation.

Shaft keyways are not needed. Expensive machining is therefore avoided and shafts can be of a smaller diameter.

Simple to align perpendicular to the shaft

KMT lock nuts can be very accurately aligned at right angles to the shaft. The three locking screws enable the nuts to compensate for inaccuracies in adjacent components. The use of a KMT lock nut will therefore minimise radial and axial runout in most assemblies.

Withstands high axial loads

The KMT design features a very long thread which accommodates high axial forces.

Ensures very effective locking

The locking screws have a relatively large diameter so the thread locking force is high with even a moderate tightening. The locking forces are applied in the best possible way because the brass locking pins do not experience any axial forces.

Re-usable

The brass locking pins do not deform when pressed against the shaft thread by the locking screws. The locking effect is provided entirely by frictional forces. KMT lock nuts can be used time and time again without any loss of precision because the locking elements are not deformed in service.

Simple to mount and dismount

KMT lock nuts are simple to fit and dismount. All nuts incorporate hook spanner notches and additionally up

to size 15 (M 75x2) two spanner flats. The choice of spanner type depends upon the application. The locking grub screws can be tightened using a standard hexagon key or torque wrench. A torque wrench is recommended if an accurate loosening torque limit is required.

KMTA lock nuts for compact design

Material: High-strength steel
Finish: Phosphated and saturated with oil
Locking pin: Hard drawn brass
Grub screw: Type MT6SS short pin (DIN 915, 45H)
Thread tolerance: 5H (ISO 965/3-1980)
Recommended tolerance for shaft threads: 6g (ISO 965/3-1980)

A high-precision lock nut

The thread and locating face are machined in the same operation. The maximum runout between locating face and thread is 0,005 mm.

Locks without a locking washer and keyway

KMTA nuts lock in the same way as KMT nuts with three radial brass locking pins. There is no need for a locking washer or keyway. Expensive machining is therefore avoided and shafts can be of a smaller diameter. The brass locking pins and the thread of the nut are machined in a single operation.

Simple to align perpendicular to the shaft

The KMTA nut can be aligned perpendicular to the shaft with the same accuracy as the KMT design. The locking screws enable the nut to compensate for the inaccuracies of adjacent components on the shaft. Axial and radial runout can be minimized.

Withstands high axial loads

The KMTA design withstands the same

high axial loads as the KMT lock nuts. This is because the entire length of the nut carries the working axial load.

Ensures very effective locking

The locking screws are of the largest size practicable in a nut of this design to maximise the locking force with even moderate tightening. The brass locking pins do not absorb a significant part of the total axial load on the nut so the locking forces are utilised in the best possible way.

Re-usable

The brass locking pins are not deformed when pressed against the shaft thread. The locking effect is purely as a result of frictional forces. Since the locking pins are not deformed the KMTA nut can be re-used without any loss of precision.

Simple to mount and dismount

The KMTA lock nut is simple to mount and dismount. The nuts all have both radial and axial holes. Hook spanners may be used on the radial holes, pin spanners on the axial holes. The lock-

ing grub screws can be tightened with either a standard hexagon key or torque wrench. A torque wrench is recommended if an accurate loosening torque limit is required.

Fine threads

KMTA lock nuts in sizes 11 to 15 have metric series fine thread pitches, these complement the metric series standard pitches of the KMT series.

KMK lock nuts for simple mounting

Material: High-strength steel
Finish: Phosphated and saturated with oil
Locking insert: Steel
Grub screw: Type MP6SS (DIN 913, 45H)
Thread tolerance: 5H (ISO 965/3-1980)
Recommended tolerance for shaft threads: 6g (ISO 965/3-1980)

Locks without a locking washer and keyway

The locking effect of the KMK lock nut is given by a loose steel insert, an integral part of the thread, being pressed against the shaft thread by a grub screw. Shaft keyways are not needed. Expensive machining is therefore avoided and shafts can be of a smaller diameter.

Axial force carried by the entire length of thread

Axial forces on the lock nut are carried by the nut thread flanks and not by the steel insert.

Effective locking

The steel insert is free to float both axially and radially. This ensures that it presses perpendicular on the shaft. The friction within the nut thread is thus increased and effective locking obtained. The locking action of the steel insert has no effect on the runout of a mounted KMK lock nut.

Re-usable

The steel insert is pressed by a locking screw against the shaft thread without any deformation of the insert or thread. The locking effect is a function of frictional force alone. Since the locking insert is not deformed the KMK lock nut can be re-used with no loss of precision.

Simple to mount and dismount

KMK lock nuts are simple to mount and dismount. Four hook spanner notches are provided around the circumference.

The locking screw can be tightened using a standard hexagon key or a torque wrench.

A torque wrench is recommended to achieve an accurate loosening torque limit.

Close tolerances

The thread and locating face are machined in the same operation. The maximum runout between the thread and the locating face is 0,02 mm.

KMF lock nuts with new locking principle

Material: High-strength steel
Finish: Saturated with oil
Locking device: Screw
Grub screw: Type MT6SS
(DIN 915, 45H)
Thread tolerance: 5H
(ISO 965/3-1980)
Recommended tolerance for shaft
threads: 6g (ISO 965/3-1980)

Locks without a locking washer and keyway

The locking effect of the KMF lock nut is achieved by tightening a screw in a threaded blind hole. This causes the thread of the nut to plastically deform and the bulge so produced to press against the shaft thread. Shaft keyways are not needed. Expensive machining is therefore avoided and shafts can be of a smaller diameter.

Axial force carried by entire length of thread

Axial forces on the lock nut are carried by the nut thread flanks. The locking force is exploited to the maximum since the bulge under the locking screw does not support the axial load.

High locking efficiency

When the nut is locked, the bulge presses at right angles to the shaft. The friction in the nut thread increases and produces efficient locking. There is no influence on the perpendicularity. The loosening torque is higher than when a locking washer is used.

Re-usable

The bulge beneath the locking screw does not deform the shaft thread and locking is solely a result of friction. To dismount, the nut should be given a slight radial knock where the screw is. This will cause the bulge to disappear.

Simple to mount and dismount

KMF lock nuts are simple to mount and dismount. Notches are provided in the circumference to take a hook spanner. The locking screw can be tightened using a standard hexagonal key or a torque wrench.

A torque wrench is recommended if an accurate loosening torque is required.

Close tolerances

The thread and locating face are machined in a single operation. The maximum axial runout between the thread and the locating face is 0,04 mm max.

KMF lock nuts

KM(L) lock nuts with locking washers

Material: High-strength steel or spheroidal graphite cast iron
Finish: Saturated with oil
Locking washer: Sheet of steel
Thread tolerance: 5H
(ISO 965/3-1980)
Recommended tolerance for shaft threads: 6g (ISO 965/3-1980)

Locks with a locking washer

The KM(L) nut is used in combination with an MB(L) locking washer and key-way for effective locking.

Easy to mount and dismount

KM(L) lock nuts can be mounted and dismounted easily with both hook and impact spanners. These spanners can be supplied by SKF.

Wide range of sizes

SKF can supply KM(L) lock nuts with both metric and inch threads as standard.

Details of lock nuts larger than metric size 40 (designated HM), inch size lock nuts and lock nuts for use with a locking clip can be found in the SKF General Catalogue or the SKF catalogue 3766 "Bearing accessories"

Details of the locking washers to suit these sizes can also be found in these catalogues.

Close tolerances

The thread and locating face are machined in the same operation. The maximum runout between the thread and locating face is between 0,04 and 0,06 mm depending on the size of the lock nut.

The SKF Group - a worldwide corporation

SKF is an international industrial Group operating in some 130 countries and is world leader in bearings.

The company was founded in 1907 following the invention of the self-aligning ball bearing by Sven Wingquist and, after only a few years, SKF began to expand all over the world.

Today, SKF has some 45 000 employees and around 80 manufacturing facilities spread throughout the world. An international sales network includes a large number of sales companies and some 7 000 distributors and retailers. Worldwide availability of SKF products is supported by a comprehensive technical advisory service.

The key to success has been a consistent emphasis on maintaining the highest quality of its products and services. Continuous investment in research and

development has also played a vital role, resulting in many examples of epoch-making innovations.

The business of the Group consists of bearings, seals, special steel and a comprehensive range of other high-tech industrial components. The experience gained in these various fields provides SKF with the essential knowledge and expertise required in order to provide the customers with the most advanced engineering products and efficient service.

The SKF Group is the first major bearing manufacturer to have been granted approval according to ISO 14001, the international standard for environmental management systems. The certificate is the most comprehensive of its kind and covers more than 60 SKF production units in 17 countries.

The SKF Engineering & Research Centre is situated just outside Utrecht in The Netherlands. In an area of 17 000 square metres (185 000 sq.ft) some 150 scientists, engineers and support staff are engaged in the further improvement of bearing performance. They are developing technologies aimed at achieving better materials, better designs, better lubricants and better seals – together leading to an even better understanding of the operation of a bearing in its application. This is also where the SKF Life Theory was evolved, enabling the design of bearings which are even more compact and offer even longer operational life.

SKF has developed the Channel concept in factories all over the world. This drastically reduces the lead time from raw material to end product as well as work in progress and finished goods in stock. The concept enables faster and smoother information flow, eliminates bottlenecks and bypasses unnecessary steps in production. The Channel team members have the knowledge and commitment needed to share the responsibility for fulfilling objectives in areas such as quality, delivery time, production flow etc.

SKF manufactures ball bearings, roller bearings and plain bearings. The smallest are just a few millimetres (a fraction of an inch) in diameter, the largest several metres. SKF also manufactures bearing and oil seals which prevent dirt from entering and lubricant from leaking out. SKF's subsidiaries CR and RFT S.p.A. are among the world's largest producers of seals.
